Tubogram

Introduction

This leaflet tells you about the procedure known as a tubogram. It explains what is involved and the benefits and risks. It may make you think of the things you would like to discuss with your doctor.

What is a tubogram?

A tubogram is an examination where a dye that shows up on X-ray is injected down your tube to check for correct positioning or whether the tube is working properly.

Why do I need a tubogram?

You or your doctor may be concerned that either your tube is not in the correct position or that it may not be working as it should do.

Who has made the decision?

Your doctors and the radiologist doing the tubogram will have discussed your situation and feel this is the best treatment option.

What to tell the doctor

- If you have any allergies.
- If you have had a previous reaction to intravenous contrast medium (the dye used for some X-rays and CT scanning).

Agreeing to treatment

We will ask you to sign a consent form agreeing to accept the treatment that you are being offered. The basis of the agreement is that you have had The Christie's written description of the proposed treatment andthat you have been given an opportunity to discuss any concerns. You are entitled to request a second opinion from another doctor who specialises in treating this cancer. You can ask your own consultant or your GP to refer you.Your consent may be withdrawn at any time before or during this treatment.Should you decide to withdraw your consent then a member of your treating team will discuss the possible consequences with you.

Who will be doing the tubogram?

A specially trained doctor called a radiologist will carry out the procedure. Radiologists have special expertise in using X-ray and scanning equipment, and also in interpreting the images produced. They need to look at these images while carrying out the procedure.

Where will the procedure take place?

In the integrated procedure unit (IPU) in the special X-ray procedure room.

Preparation for a tubogram

There is no preparation required for this procedure.

What are the risks and complications of the procedure?

Rarely patients have an allergic reaction to the contrast dye used in the procedure. Medications are available in the department if this does happen to occur.

If you have had a previous reaction to intravenous contrast medium (the dye used for some X-rays and CT scanning), please inform the radiology department before your appointment.

What actually happens during the procedure?

A special liquid called contrast or dye which shows up on X-ray is injected into the tube. As the contrast is injected down the tube and into your body X-ray pictures are taken so the radiologist can check the tube is in the correct place.

Will it hurt?

This is usually not a painful examination. If you do experience any discomfort there will be a nurse in the room with you who you can tell.

How long will it take?

This examination will take between 5 and 15 minutes.

What will happen after the procedure?

If you have come for this procedure as an outpatient you will be able to go home straight away. If you are an inpatient you will be sent back to the ward, no special after care will be required.

Further information

This is available from the radiology department on the phone numbers below or from the following websites:

Macmillan Cancer Support: www.macmillan.org.uk
