

Diagnosis and Management of Myeloid Malignancies - Blog

Monday 22nd October 2018

Calling all those working in haematology:

Hello! I'm Roxy Spencer and I am one of the Haematology nurses specialists at The Christie. I've been here since 2015 and my main role is to be a key worker for patients with myeloid malignancies. I support them during and after their treatments as well as through their whole cancer journey.

About the study day?

The study day will cover a variety of myeloid diseases such as: acute myeloid leukaemia, chronic myeloid leukaemia and myeloproliferative disorders. The study day will look at a range of topics from diagnostics to treatment (including novel therapies as well) but then also looking more holistically at how we look after patients, the challenges they can present and studying the older patient too.

The study day is aimed at everyone—whether you are experienced or not in haematology there is something for everyone on the programme.

This presents a great opportunity to expand your network because these study days attract people from all over the UK and Europe.”

Networking Opportunities:

There are a lot of leading experts in the field attending. We are extremely lucky to have Professor O’Brian coming from Newcastle to talk about CML and Professor Summerville from here at The Christie who will discuss myeloproliferative disorders. This presents a great opportunity to expand your network because these study days attract people from all over the UK and Europe.

Days Aims:

Increasing and enhancing knowledge of people working within Haematology is the primary aim of this study day. It’s a great chance to share best practice by networking with professionals in this field.

Why you should attend:

It’s a really exciting time for Haematology right now as things are changing. Treatments are getting better and there are new ones coming through. I think it’s really important that as a specific study day surrounding myeloid diseases to ask any questions about these. It also gives the chance to learn about how we meet the expectations of patients and how to support them through these new treatments.

Treatments are getting better and there are new ones coming through. I think it’s really important to ask any questions about these.
